Ensuring Accountability and Public Trust: Continual and Collaborative Review of Court Performance

Montgomery County Circuit Court manages and tracks the progress of its cases, monitoring in particular, its caseload and case processing performance to ensure that court operations are both effective and efficient. Montgomery County Circuit Court is a leader in case management, as well as data quality and case processing analysis. The court’s performance is comparable to several other Maryland jurisdictions as similar case management practices and monitoring systems have been implemented statewide.

Despite the resource challenges of the past several years, including budget reductions, the Hon. John W. Debelius III, Circuit and County Administrative Judge, the Hon. Barbara Meiklejohn, Clerk of the Court, and Court Administrator Judy K. Rupp have reaffirmed their commitment to maintaining and enhancing court operations to fulfill the court’s mission of administering justice in an honest, fair, and efficient manner. Resources are allocated to ensure that case information is collected and recorded in a matter that provides an accurate reflection of the court events. Further, all concur that the court’s management decisions, in particular those regarding case processing, should be based on systematic analyses of data that it collects, rather than relying upon anecdotal events or assumptions.

Understanding how court performance relates and responds to the county’s demographic profile, its economic climate, as well as budgetary constraints are important components to the efficient management of the court’s caseload and allows anticipation of community needs with regard to the court. To achieve these goals, court leaders engage in close communication, collaboration, and coordination.

Responsibility for upholding the court’s core mission must--and does--extend beyond the executive leadership team to all court staff. Court leadership has fostered strong staff awareness of and commitment to the importance of recording and collecting data that reflects the court’s performance and has instilled the understanding that, while there is a large amount of paperwork associated with each case, the circuit court is not merely processing paper but rather serving the residents of Montgomery County with legal matters that affect their lives.
Montgomery County Statistics and their Impact on the Circuit Court Caseload

This section of the statistical digest highlights some characteristics of the residents served by the Montgomery County Circuit Court. Understanding the county’s population, its trend and characteristics is important because it helps inform the development of programs and services that the court currently provides and may need to provide to meet future needs of county residents. Furthermore, by monitoring socio-demographic trends, courts are in a better position to make informed decisions related to the resources required to support the efficient and effective administration of justice.

Population of Montgomery County

According to the U.S. Census Bureau, Montgomery County’s estimated population in 2013 exceeded one million (1,016,677), adding 44,900 residents (a 4.6% increase) since 2010 (971,777). The county has remained the most populous jurisdiction in the state since 1989 and is the 40th most populous county in the United States based on the 2013 Census estimates, moving up from the 41st position in 2011 and 2012 and 42nd position in 2010.

Montgomery County is also the only Maryland jurisdiction with a population over 1 million, accounting for 17.1% of the state’s 5.9-million population. Montgomery County has nearly 127,000 more residents than Prince George’s County (890,081), the next most populous county in the state (see Table 1). Between 2000 and 2013, Montgomery County’s population increased by 15.9%, more than 139,000. The increase is by far the largest for the state followed by an 87,000 increase (10.8%) in Prince George’s County; a 67,000 increase (8.9%) in Baltimore County; and a 64,000 increase (13.0%) in Anne Arundel County. The average percentage growth rate of the county’s population was 1.4% per year between 1990 and 2000, which declined to 1.1% during 2000s but improved to 1.4% between 2010 and 2013. While the rate is no

Figure 1. Historical and Projected Total Population, Montgomery County, 1970-2040

Sources: Maryland State Data Center, Maryland Department of Planning, Demographic and Socio-Economic Outlook: Montgomery County (Revisions, January 2014). [http://planning.maryland.gov/MSDC/County/mont.pdf](http://planning.maryland.gov/MSDC/County/mont.pdf), accessed on 1/14/2015

One of the leading forces behind the county’s current population growth is the much greater number of births (on average 13,400 births per year between 2000 and 2012) than deaths (on average 5,500 per year for the same period),5 resulting in an average net increase of 7,900 in the county’s population. A second

---

---
contributing factor is the influx of new residents, in particular, those from other countries (on average 9,100 international immigrants per year between 2000 and 2013). On the other hand, on average 5,500 individuals move out of the county to somewhere else in the United States per year between 2000 and 2013, resulting in an average net increase of 3,600.6

Impact on the Circuit Court Caseload

Of the case types that Montgomery County Circuit Court hears (civil, criminal, family, and juvenile delinquency and child welfare), family law cases, which deal with divorce and other family law-related matters, are more likely to be closely associated with the county’s population trends than other types of cases. In fact, the number of family law case filings steadily increased from 12,300 in FY2000 to 15,100 in FY2010, reflecting the county’s population growth.7 However, the growth of family law case filings somewhat halted, fluctuating around 14,700 from FY2011 and FY2014. While the upward trend in family law case filings is expected to continue following the county’s population growth, it may also be impacted by various factors such as shifts in the composition of the population in terms of age, race/Hispanic origin, nationality, the county’s socioeconomic climate, and legislative changes (such as legalization of same sex marriages). While family filings surpassed civil filings, that trend reversed in FY2008 and FY2010 when the court’s civil filings exceeded family filings due to large increases in foreclosure filings; however, as the foreclosure filings returned to the pre-foreclosure level in FY2011, the court processed more family case filings than civil filings.

Examining Racial Diversity - Minorities are Majority Population8

Along with the population growth, Montgomery County has been experiencing increased racial and ethnic diversity in its population. Between 2000 and 2010, the population of Montgomery County increased by more than 98,000 from 873,341 to 971,777.9 During the same 11-year period, the number of white, non-Hispanic residents declined by 40,600 from 519,300 to 478,800, whereas the numbers of county residents who are not White, largely black or African American or Asian, and/or of Hispanic origin, increased by

---

7 The county’s fiscal year stretches from July 1st to June 30th.

8 The analysis in this section uses population data and estimates from the U.S. Census, which collects race and Hispanic or Latino origin in two separate questions. Accordingly, individuals of any race could be of Hispanic origin, and those who are of Hispanic origin could be of any race.

143,900 from 349,100 to 493,000 residents, accounting for 50.7% of the county population in 2010.\textsuperscript{10} By 2035, two thirds of the county residents are expected to be non-White or Hispanic (alone and two or more races).

Figure 2 presents the estimated racial composition of the county’s population as of 2013 based on the 2010 U.S. Census. While the percentage of Montgomery County residents who are White (55.5%, including both Hispanic and non-Hispanic origin) is comparable to the statewide percentage (57.6%), the percentage of black or African American residents is substantially lower (17.5% for the county versus 29.6% statewide). In contrast, the percentage of Asian residents in the county (14.4%) is much greater than the statewide percentage (6.0%). In fact, 41.2% of the state’s Asian population resides in Montgomery County. Also over-represented among the county’s population are individuals with some other race alone (82,000, 8.1% in the county compared to 3.6% statewide) and those with two or more races (44,200, 4.3% in the county compared to 2.9% statewide), again underscoring the diversity of Montgomery County residents.

**Figure 2. Montgomery County Population by Race, 2013**

Another major driving force behind Montgomery County’s diversity is the large influx of individuals of Hispanic or Latino origin. Irrespective of race, a little over 100,000 of Montgomery County residents in 2000 were of Hispanic or Latino origin. As of the 2010 U.S. Census, the county’s Hispanic or Latino residents increased by 64,800 from 100,604 to 165,400 (a 64.4% increase), increasing their representation

\textsuperscript{10} Maryland State Data Center, Maryland Department of Planning, *Demographic and Socio-Economic Outlook: Montgomery County (Revisions, January 2014)*. (http://planning.maryland.gov/MSDC/County/mont.pdf, accessed on 1/14/2015)
from 11.5% to 17.0% since 2000. According to the 2013 Census estimates, close to 186,000 (18.3%) of the county residents are now of Hispanic origin, surpassing the Asian population (146,136 if Asian alone, 168,600 if Asian alone or in combination with one or more other races) and becoming the second largest minority population after black or African American population (177,500 if black or African American alone, 197,400 if black or African American alone or in combination with one or more other races). As indicated above, between 2000 and 2010, the number of White residents who are not of Hispanic or Latino origin decreased by 40,600 from 519,300 to 478,800, reducing their representation from 59.5% in 2000 to 49.3% in 2010. Thus, the county’s non-Hispanic, White population no longer represents a majority of the population. As Figure 1 shows, this trend is expected to continue, and by 2040, only 32% of the county’s 1.2 million residents will represent the non-Hispanic, White population.

Increase in Foreign-Born Residents

One major characteristic of the county’s population growth is that it has been fueled by the increase in the number of residents who were born outside the United States. Based on the 2013 U.S. Census American Community Survey estimate, 332,800 or nearly one third of Montgomery County residents are foreign-born. As shown in Table 2, since 2000, the number of foreign-born residents increased by almost 100,000 (99,800, a 43% increase) while the county’s overall population and the residents born in the United States increased by 16% and 7%, respectively. In fact, foreign-born residents account for nearly 70% of the county’s population increase between 2000 and 2013. Compared to the state overall, the representation of foreign-born residents in Montgomery County is much greater (14% versus 33%), and nearly 40% of such individuals reside in the county. In terms of the U.S. citizenship status of foreign-born Montgomery County residents, 54% (179,100) are naturalized U.S. citizens, whereas the remaining 46% are not U.S. citizens.

The bottom half of the table shows the breakdown of region of birth among foreign-born residents. In 2000, 38% of the county’s foreign-born residents were from Asia and another 35% from Latin America. Combined, these two groups constituted over 70% of the county’s foreign-born population. Between 2000 and 2013, the number of residents in both groups increased. However, the increase of residents born in Latin America was much greater (39,100, a 48% increase) than that of residents born in Asia (31,100, a 35% increase). As a result, in 2013, those born in Latin America account for 36.4% and those born in Asia account for 36.1% of the county’s foreign-born residents. In terms of the rate of increase, the number of residents born in Africa more than doubled between 2000 and 2013 from 25,800 to 54,800.

* Excludes Individuals born at sea

The diversity of nativity in the county’s population and the increased representation of foreign-born residents among the county’s population are also reflected in the wide spectrum of languages spoken by its residents. As shown in Table 3, according to the 2013 American Community Survey, 377,800 (40%) of the county’s residents who are five years and older speak a language other than English at home. In addition, over 136,700 county residents (14% of the total residents aged 5 or older and 36% of those who reported that they speak a language other than English at home) reported that they speak English less than ‘very well’.
The percentage of Montgomery County residents who speak languages other than English at home (40%) is substantially greater than that statewide (17%) and among the U.S. (21%). There are also a greater percentage of county residents who reported speaking English less than ‘very well’: 14% for Montgomery County compared to 6.3% for Maryland and 8.5% for the U.S. However, the percentage of individuals who reported speaking English less than ‘very well’ among those who speak languages other than English at home is comparable among Montgomery County (36%), statewide (37%) and the U.S. (41%).

While the percentage of individuals with limited English proficiency among non-English speaking Montgomery County residents is similar to the state and national averages, the sheer volume of such individuals (136,700) in the county makes language/communication-related issues more critical in Montgomery County than other jurisdictions since close to 40% of individuals with limited English proficiency in the state reside in the county. This is particularly important for the court in its efforts to ensure that all parties understand court proceedings and to communicate with judges and other parties involved in the case.

Impact on the Circuit Court Caseload

Increased diversity in the county’s population in terms of its primary language has significantly impacted the court’s daily operations and its ability to provide services to the community. The court experienced a substantial increase in the number of requests for foreign-language interpreting services for hearings, trials, and other ancillary programs. Figure 3 shows the number of invoices that the court received for foreign-language interpreter services between FY2000 and FY2014. The court’s foreign-language interpreter services increased rapidly from slightly over 400 invoices in FY2000 to over 1,700 in FY2006-FY2007.

The increase in interpreter services experienced in early 2000 is attributed to service needs for Spanish speaking residents as well as residents who speak foreign languages other than Spanish. In mid-2000, while the number of Spanish interpreter service invoices leveled off, the number of non-Spanish foreign-language invoices continued to rise through FY2008 reaching the same level as that of Spanish interpreter services. In FY2008, the number of invoices for Spanish interpreting services declined by almost 30% to 649 when the court hired five part-time Spanish interpreters, who are not required to file invoices for their services. The number of invoices for Spanish interpreting services, which accounted for over 50-60% of the interpreter invoices in the years immediately preceding the hiring of Spanish staff interpreters, further declined to 256 in FY2009 and remained around 300 in FY2010 and FY2013. However, the number of Spanish language service invoices increased by almost 100 (34%) from 288 to 386 between FY2013 and FY2014.

Figure 3. Numbers of Foreign-Language and Spanish Interpreting Service Invoices Submitted,* FY2000-2014

Note: These numbers are based on the invoices submitted by interpreters who provided services. * Excludes 1,458 interpreter services that do not involve foreign-language interpretations (such as American Sign Language, Real Time Captioning, CART Services, Cued Speech and Caption Reporting) and those for which language information is not available (such as interpreter services for co-parenting classes). Since (in most cases) interpreters submit an invoice per day rather than per service, the actual number of services is much greater than the number of invoices submitted. Also, note that a portion of the FY2008 data and all FY2009 - FY2014 data do not include the services provided by the five Spanish interpreters hired as part-time court employees.

Figure 4 illustrates the magnitude of language diversity reflected as the number of foreign languages for which the court provided interpreter services. The number of languages increased substantially from 15
languages in FY2000-2001 to 38 languages in FY2006 and has remained around that level. Since several languages are grouped into a single category (such as Chinese, which includes a number of dialect such as Cantonese, Mandarin, Fukienese, Taishanese, Hainanese, and Fuzhou), the actual number of the languages may be 50 or higher. In addition, since (in rare instances) the court may not be able to locate an interpreter for a particular language, the actual number of foreign-languages for which spoken language services are requested may be even greater.

The figure also displays the percentage of interpreter service invoices for non-Spanish languages. After a steady increase from 32% to 47% between FY2003 and FY2007, corresponding to the similar upward trend depicted in Figure 3, the percentage of interpreter invoices for non-Hispanic languages jumped to 59% in FY2008 and then to 78% in FY2009. This sudden increase is due to the hiring of part time Spanish staff interpreters who do not file invoices for their services, thus reducing the number of Spanish-language invoices. The demand for Spanish language interpretive services (see Figure 3) would have been much higher than that for non-Hispanic language services if the workload of the Spanish staff interpreters had been included in the FY2008 through FY2014 figures.

**Figure 4. Number of Foreign-Languages for which Interpreter Services were Provided and Percent of Interpreter Service Invoices Submitted for Non-Spanish Languages,* FY2000-FY2014**

Note: These numbers are based on the invoices submitted by interpreters who provided services.

* Excludes 1,563 invoiced interpreter services that do not involve foreign-language interpretations (such as American Sign Language, Real Time Captioning, CART Services, Cued Speech and Caption Reporting) or those for which the specific language information is not available (such as interpreter services for co-parenting classes).
For FY2000-FY2014, the most frequently requested language for interpreting services in terms of the number of invoices submitted is Spanish, accounting for 46% of all the invoices, and the distant second is Chinese (8.2%), followed by Vietnamese (7.5%), French (6.4%), Ethiopian (Amharic and Tigrina) (5.3%), and Korean/Hangul (5.0%). Combined, these six languages account for 79% of the total foreign-language interpretive service invoices.

*Figure 5. Total and Average Charges for Foreign Language Interpreting Services,* **FY2000-FY2014**

Providing these interpreter services is not inexpensive. The line graph in Figure 5 depicts the amount of funds used to support foreign-language interpreter services based on the invoices submitted. The trend somewhat follows that of the number of invoices submitted shown in Figure 3, except for FY2004-FY2007 when the total invoice charges continued to rise, in particular between FY2006 and FY2007 when it jumped from $330,000 to $450,000 while the number of invoices tapered off between FY2007 and FY2008. Total charges substantially declined in FY2008 and FY2009 and have remained at the FY2004-FY2005 level between FY2010 and FY2014. The trend in the average charge, shown in the bar graph portion of the figure, explains the sudden FY2006-FY2007 increase. Between the two fiscal years, the average charge for foreign language interpreter services increased by $70 from $190 to $261 while the number of invoices increased only by six (from 1,731 to 1,737 invoices). In fact, the court received four of
the 10 most expensive invoices in FY2007, all for African languages. The average charge remained at a rate of more than $200 after FY2007, although it has been gradually declining and was $207 in FY2014.

In addition to providing foreign-language interpreter services, Montgomery County Circuit Court offers Americans Disabilities Act (ADA)-related language services for eligible individuals, such as translation using American Sign Language, caption reporting, and communication access real-time translation (CART) services. Thus, by fully complying with the ADA requirements to make reasonable accommodations for residents/litigants with disabilities, the court ensures equal access to justice.

Figure 6 provides the number of invoices submitted to the court and total charges for ADA-related interpreting services. Between FY2000 and FY2014, 1,561 invoices were processed. The number of invoices increased dramatically from fewer than 40 to over 200 between FY2003 and FY 2007, declined to 62 in FY2010, and gradually increased back to around 107 invoices in FY2014. The trend of total charges fairly closely follows that of the number of invoices, increasing from $30,000 per year in FY2003 to $87,000 in at FY2007, declined to $40,000 in FY2009, and fluctuated around $40,000-$50,000 since then.

Figure 6. Total Charges and Number of Invoices for ADA-Related Interpreting Services, FY2000-FY2014

* Expenditures are based on the invoices submitted by interpreters who provided interpreting services that do not involve foreign-language interpretations, such as American Sign Language, Real Time Captioning, CART Services, Cued Speech and Caption Reporting.
**Maturing County population**

Like many other communities in the nation, the population of Montgomery County is maturing with the aging of the “Baby Boomer” population (those born between 1946 and 1964). Over the past three decades, the median age of the county’s population increased from 28 in 1970, 32 in 1980, 34 in 1990, 37 in 2000, and 39 in 2010. In 2013, the population’s median age slightly declined to 38 (38.4). The county’s median age is expected to increase not only as the dominating post-World War II baby boomers age but also because of improving life expectancy of older generations, though the continuing influx of younger individuals to the county will slow that trend.

**Figure 7. Historical and Projected Montgomery County Population by Age Group, 1970 – 2040**

Another trend among this segment of the population is the increased life expectancy of the population (78.7 years for male and 81.1 years for female in 2011). Figure 8 provides the population of Montgomery County by age group for 1980, 2010 and 2040 (estimated) on the left and the percent distribution of the population by age group for the same three years on the right.

---

The aging of the county’s population is also evident from an ever-increasing proportion of its segment aged 65 years and older. As shown in Figure 7, this age group represented only 6% (32,600) of the county’s population in 1970. By 2000 the number tripled to 98,200, accounting for 11% of the county’s residents. Between 2000 and 2010, the number of residents 65 years and older increased by 20% to 119,800, representing 12% of the county’s total population. In 2013, 135,600 (13%) of the county’s residents are aged 65 years and older. \(^{18}\) By 2040, this portion of the county’s residents is expected to reach 254,500, accounting for 21% of the county’s overall population.

**Figure 8. Montgomery County Population by Age Group, 1980, 2010, and 2040 (Estimated)**

The chart on the left shows that between 1980 and 2010, the county’s population growth took place across all age groups but in particular aged 45-54 and 35-44 groups, contributing an increase of 125,000 residents. Between 2010 and 2040, while the county’s population is expected to continue growing across all age groups, the largest population growth is expected to take place among individuals aged between aged 65 and 84, accounting for an increase of over 75,000 residents. According to the 2013 Census estimates, 60,600 (45%) of the 135,600 aged 65 and older residents are 74 years of age or older, compared to 57,200 in 2010 and 48,100 in 2000. Furthermore, 35% (21,100) of the county residents who are 75 years and

---

older (60,600) are at least 85 years of age in 2013, compared with 34.0% (19,400/57,200) in 2010 and 27% (13,000/48,100) in 2000. Given the improved life expectancy and universal health care coverage for the nation’s elderly population through Medicare, this segment of the county’s population is expected to continue increasing. The figure on the right, which compares the percent distribution of the county’s population by age group for 1980, 2010, and 2040, features the distinctive age profile of the county population for each year. The 1980 population is characterized with a higher proportion of individuals aged 10 to 34 years, compared with the 2010 and 2040 populations. The distinctive feature of the 2010 population is that it has a higher percentage of residents aged 45 to 54 years than the other two populations. In contrast, the 2040 population is expected to have a much higher proportion of residents aged 65 years old or older.

**Impact on the Circuit Court Caseload**

One of the issues that the county will face is the increasing number of residents in need of assistance with disabilities. According to the 2013 U.S. Census estimates, over 17% of the county residents aged 65 to 74 years and 27% of those aged 75 and over reported having some kind of ambulatory disability, compared with 0.5% among those aged between 5 and 34 years old and 3% among those between 35 and 64 years. As the county’s population ages, it is likely that the court will experience some shift in its caseload, including an increase in appointment of guardianship cases and elder abuse cases.

Figure 9 presents the number of petitions for Adult Guardianship filed with Montgomery County Circuit Court between FY2001 and FY2014. The filings, which fluctuated between the mid- to high 100s between FY2001 and FY2008, have been on the rise since FY2009, reaching almost 300 petitions a year in FY2013.

---

Crime Statistics

As shown in Figure 10, the number of crimes reported by the Montgomery County Police Department has been in decline since calendar year 2008. The number of reported crimes was fairly constant around 70,000 between 2001 and 2007 with a slight decline in 2004 and 2005 to 66,500 and 67,400, respectively. After peaking at 72,500 in 2008, the number of crimes declined by 14,400 (19.9%) in three years to 58,100 in 2011 and remained at that level in 2012. In 2013, the number further declined to 52,900. Between 2008 and 2013, the number of reported crimes declined by 27%.

The figure also provides the breakdown of crimes by crime type (Part I and Part II). The reduction in the number of crimes since 2008 was brought about equally by the reduction of both types of crimes, although the number of Part II crimes slightly increased from 38,700 to 39,600 between 2011 and 2012, only to decrease below the 2011-level to 35,700. The number of Part I crimes continued to decline from 27,000 in 2008 to 17,200 in 2013.

---

Figure 10. Number of Overall, Part I and Part II Crimes Reported in Montgomery County, Calendar Year (CY) 2001-2013

Figure 11 presents the trend of reported Part I crimes and its breakdown between violent crimes (murder, rape, robbery, and aggravated assault) versus property crimes from calendar year 2001 to 2013. Between 2001 and 2013, the overall number of Part I crimes declined from 27,000 to 17,200; in particular the number of the crimes has been steadily declining since 2008. As the figure shows, the overall trend of Part I crimes in Montgomery County is determined by that of property crimes, which account for over 90% of the reported Part I crimes in the county.

Figure 12 presents a more detailed trend of reported Part I violent crimes by crime type (murder, rape, robbery, and aggravated assault) for 2001 through 2013. The number of violent crimes increased from 1,972 in 2001 to 2,304 in 2006 but has been declining since then except for between 2011 and 2012, when the number increased from 1,689 to 1,874. In 2013, however, the number declined to 1,665, the lowest number since 1985. The two main crime types – robbery and aggravated assault, which account for over 90% of reported violent crimes, drive the overall number of the county’s violent crimes. The trend in the overall number of Part I violent crimes in the early 2000s were largely influenced by robbery; between 2009 and 2013, the large fluctuations in the number of aggravated assaults determined the patterns of Part I violent crimes while the steady decline in the number of robbery arrests set the overall trend.
Figure 11. Number of Reported Part I Violent and Property Crimes, CY2001-2013

Figure 12. Number of Part I Violent Crimes Reported by Type, CY2001-2013

The numbers of murder and rape, both of which are much smaller than that of robbery or aggravated assaults, have also been in gradual decline. Rapes reported in the county ranged from 140 to 150 per year in the early 2000s; however, after peaking at 157 in 2005, the number declined to 106 in 2012 and increased slightly to 130 in 2013. Reported murders in Montgomery County, which were highest (32) in 2002, fluctuated around 20 per year between 2001 and 2008 and have since declined to no more than 16 in recent years. In 2013, the number of reported murders further declined to eight (8).

Table 4 compares the number and the rate of occurrences (per 1,000 residents) of Part I crimes reported in 2013, which are more likely to be brought to the circuit court if charged, and the number and rate of original and reopened criminal cases filed during FY2013 (overall and indictments/informations only). Despite having the largest population, the overall crime rate of Montgomery County (17.7 Part I crimes per 1,000 residents) is much smaller than any other large jurisdiction (34.7) and the statewide average (32.3). While large jurisdictions as a group represent 66% of the state’s 2013 population, the percentage of Part I crimes reported by those jurisdictions among Part I crimes reported statewide account for 73%.

* Crime rates are calculated per 1,000 residents.
† Includes original and reopened filings

Although Montgomery County accounted for 17% of the state population in 2013, it represented less than 10% of the state’s Part I crimes. In fact, Montgomery and Anne Arundel Counties are the only jurisdictions of the six large jurisdictions in the state with a Part I crime rate lower than the statewide average. Further, Montgomery County’s crime rates are substantially lower than those of Anne Arundel County. This is particularly noteworthy for violent crimes (murder, rape, robbery, and aggravated assault); Montgomery County’s violent crime rate is 1.7 crimes per 1,000 residents, less than half of that
of Anne Arundel County (4.2 crimes per 1,000 residents), accounting for only 6.4% of the state’s violent crimes reported in 2013.

**Impact on the Circuit Court Caseload**

Montgomery County’s lower-than-average violent crime rate appears also to be reflected in the number of criminal cases. During FY2013, 6,400 criminal cases (original and reopened) were filed with Montgomery County Circuit Court, which is only slightly lower than the total criminal filings for Anne Arundel County Circuit Court (6,700 filings), which serves a population that is about 55% of Montgomery County’s population. Accordingly, the county’s per capita criminal case filing rate is much smaller (6.3 case filings per 1,000 residents) than that of other large jurisdictions in the state, as well as the statewide average (14.1 cases per 1,000 residents).

*Crime rate and criminal case filing rate are calculated per 1,000 residents.
†Includes original and reopened filings

Interestingly, when filings of indictments and informations are compared, some of the jurisdictional differentials become less evident or disappear. For example, Montgomery County’s filing rate for indictments and informations is slightly higher than that of Prince George’s County (See Table 5, 4.6 vs. 4.4, respectively). In addition, the court has a larger number of the District Court appeals than any other large-jurisdiction court though its per-capita filings (1.2 filings per 1,000 residents) are comparable to those of other large jurisdictions except for Prince George’s County (0.6 filings per 1,000 residents). In contrast, the number of the District Court jury trial prayers filed with Montgomery County Circuit Court is far smaller (370) than any other large-jurisdiction court thanks to the court’s strict instant jury trial policy.
implemented since the early 2000s to process jury trial prayers on the same day as they are filed. The court’s per capita filing rate (0.4 filings per 1,000 residents) is nearly one eighth of that of Anne Arundel County Circuit Court (3.0 filings per 1,000 residents) and one sixteenth of the statewide average (6.4 filings per 1,000 residents).

**Figure 13. Circuit Court Original Criminal Case Filings by Case Type, FY2000-FY2014**

Source: Montgomery County Circuit Court, Data Processing

Figure 13 presents the trends of original criminal case filings at Montgomery County Circuit Court from FY2000 to FY2014. The court’s criminal caseload consists of two types of cases: those filed in the court as criminal indictments and informations and those forwarded from the District Court upon a demand for a jury trial or an appeal, over 80% of which come as appeals. The number of the court’s overall original filings declined from 3,932 in FY2001 to 2,197 in FY2003 when the court implemented an instant jury trial policy to hold trials on the same day that demands for jury trials are made in the District Court. As a result, the percentage of the court’s original criminal case filings forwarded from the District Court declined from 74% in FY2001 to 47% in FY2004 and continued to decline, reaching 39% in FY2013 though it slightly increased to 40% in FY2014. Between FY2003 and FY2011 the number of filings increased from 2,200 to 2,700 but declined to the FY2003 level in the following years. The number of criminal cases filed as indictments or criminal informations in the circuit court gradually increased from around 1,090 in FY2003 to 1,490 in FY2011. This number declined to 1,290 in FY2012 and remained unchanged in FY2013, with a slight increased to 1,340 in FY2014. Filings of cases tracked as complex (cases with serious offenses such as homicide, rape, first and second degree sex offenses, child abuse,
major fraud, arson, and DNA cases) increased by almost 75% from 200 in FY2000 to 348 in FY2010 though they slightly declined to 266 in FY2012 (also 266 in FY2013) but increased to 289 in FY2014.

**Domestic Violence Statistics**

Figure 14 presents the number of domestic violence (DV) incidents reported in Montgomery County between 2000 and 2013 based on the *Uniform Crime Report (UCR)*. The number of DV incidents declined from 2,220 in 2000 to 980 in 2010, followed by slight increases over the next few years to 1,430 in FY2013. The observed increase from 1,137 in 2012 to 1,430 in 2013 is due in part to the expanded definition of domestic violence under HB116/SB647 that was signed into law in 2012 to improve recording and tracking of domestic violence crimes. Prior to the law change, the only reported relationship for domestic violence crimes were spouses (husband and wife) and cohabitant. Under the new law, 10 additional relationships are included. 24

Figure 14. Domestic Violence Incidents Reported in Montgomery County, CY2000-2013

Note: the increase in the number of reported incidence in CY2013 is in part due to expanding the definition of domestic violence to include 10 additional relationships. See Prevention, *Crime in Maryland – Uniform Crime Report, Year 2013* [http://www.goccp.maryland.gov/msac/documents/2013_Crime_in_Maryland_UCR.pdf, accessed on 2/02/15].

---

In contrast to the trend in the county’s DV incidents, the number of original filings of DV petitions for a protective order in Montgomery County Circuit Court and the District Court (Rockville/Silver Spring locations) for FY2005 through FY2012 (see Figure 15) increased 27% from 2,200 to 2,800 during the same period, followed by a slight decline in FY2013 and FY2014. Approximately 75% of DV petitions are filed in the District Court, with the remaining 25% filed in the circuit court.

The diverging trend between the number of protective order petitions filed and the number of DV incidents reported to the police, as well as the gap between the two numbers (the number of petitions for protective order is much greater than that of DV incidents), may be due to parties involved in a single incident filing petitions seeking protection from the other. In addition, petitions filed in the circuit court include some that have been transferred from the District Court due to existing family law proceedings in the circuit court involving the parties or have been appealed by a party. The observed divergence might also be an indication of latent domestic violence cases that are not reported to the police, where victims may be proceeding directly to court to obtain protective orders.

Figure 15. Domestic Violence Case Filings (Original) in Montgomery County, Circuit and District Courts, FY2005-FY2014

Note: Circuit Court DV filings also include those DV cases that were transferred from the District Court by jurisdictional transfer or appeal.
While Montgomery County Circuit Court and the District Court serve as the primary source of legal assistance for protection from domestic violence, county residents often seek other types of assistance in addressing these situations. As reported in the court’s annual report,25 Montgomery County’s Family Justice Center (FJC) provides information and services (both legal and non-legal) to residents seeking domestic violence assistance. The FJC also provides assistance to domestic violence victims in completing court paperwork, obtaining legal assistance, and serves as a remote site for victim attendance and testimony using video-conference technology to host hearings on ex-parte temporary protection order petitions conducted by the county’s circuit court and District Court (Rockville location).

Workload and Case Processing Analysis

The Montgomery County Circuit Court is committed to its mission – administering justice in an honest, fair, and efficient manner. As part of its efforts to ensure accountability, the court continually reviews its workload and case processing performance to identify areas in need of improvement. For example, researchers conduct analyses of the court’s data and present results to judges and other court personnel and stakeholders on a regular basis in an effort to facilitate data-driven approaches to court and case management.

Workload Analysis

Key workload metrics that the court reviews include the number of filings, terminations, hearings, and trials that occur annually in civil, criminal, family, and juvenile cases. The following figures highlight information related to these key workload factors.

Figure 16. Number of Cases Filed by Case Type, FY2000 - FY2014

Source: Montgomery County Circuit Court, Data Processing. Transfer of the juvenile court from the District Court to Montgomery County Circuit Court occurred in 2002. Data for fiscal years prior to 2003 was obtained from the Maryland Judiciary.

Montgomery County circuit court case filings (original and reopen) averaged 37,583 between FY2000 and FY2014, ranging from a low of 33,200 filings in FY2006 to a high of 44,800 filings in FY2010 (results not...
Figure 16 displays the total number of filings by case type between FY2000 and FY2014. As shown in the figure, all case types, despite the surge in civil filings between FY2008 and FY2010, have remained relatively constant since FY2000. Family and Criminal filings have increased over the past 15 years by 17% and 9%, respectively. Civil filings exhibited a substantial increase between FY2007 and FY2010 from 11,806 to 18,225 filings mainly due to a large increase in foreclosure filings. In FY2011, civil filings dropped by 33% to 12,225 and remained at that level since FY2013. The 64% decline in juvenile filings between FY2000 and FY2014 is worthy of note. Between FY2000 and FY2007, the number of juvenile filings declined by 48% from 7,600 to 3,900 with an annual average decline of 521 filings per year. Juvenile filings subsequently declined by 41% from FY2010 to FY2014, with an annual average decline of 472 filings per year.

</table>

As shown in Table 6, across case types between FY2000 and FY2014, filings initiated from a family or civil petition/complaint comprised a minimum of 65% to a maximum of 76% of the court’s overall filings. The representation of civil filings among all court case filings increased from 33% in FY2007 to 41% in FY2010, reflecting the large influx of foreclosure filings during that period. As a result of this change in civil filings, between FY2007 and FY2010, the percentage of family filings among all case filings declined from 39% to slightly over one-third (34%). Between FY2012 and FY2014, however, family cases comprised 40% of all original and reopened filings. Criminal and juvenile (including delinquency and child welfare) filings have remained relatively constant over time, each representing less than 20% of the court’s total case filings.
Montgomery County circuit court case terminations (original and reopen) averaged 37,460 between FY2000 and FY2014, ranging from a low of 33,086 filings in FY2007 to a high of 44,600 filings in FY2010 (results not displayed). Figure 17 highlights the total number of case terminations by case type between FY2000 and FY2014. The termination trends are similar to the filing trends displayed in Figure 16. Family and Criminal terminations have increased over the past 15 years by 20% and 11%, respectively. Juvenile terminations experienced a 61% decline in terminations between FY2000 and FY2014 comparable to the 64% decline experienced in filings during the same period. Similar to filings, despite the increase in civil terminations between FY2007 and FY2010, there has been only a slight change in the civil termination trend between FY2000 and FY2014 (1% decline). Between FY2000 and FY2007, the number of juvenile terminations declined by 53% from 7,400 to 3,500, with an annual average decline of 558 filings per year. Since FY2007, juvenile terminations increased slightly to 4,300 in FY2008 and over 4,700 in FY2010. Over the past four years, however, there has been an annual average decline of 463 terminations per year.
Case termination trends mirror total case filing trends. As shown in Table 7, across case types, slightly over two-thirds to three-quarters of case terminations are family and civil matters. In FY2010 and FY2011, 40% and 38% of the total terminations were civil matters, reflecting the court’s efforts to process a large number of foreclosure cases, and slightly over one-third were family matters. Similar to FY2012 and FY2013, in FY2014 civil matters represented about a third of total terminations, whereas 40% of the total terminations were family matters. Since FY2000, no more than 20% of the total terminations have been criminal or juvenile (delinquency and child welfare) case terminations.

One of the ways to assess how efficiently courts are processing cases is to calculate the case clearance rate, which is calculated by dividing the number of terminations by filings for a given time period. A clearance rate over 100% indicates that a court has more case terminations than filings, suggesting higher case processing efficiency through addressing case backlog. In contrast, a clearance rate of less than 100% indicates that the court was not able to close as many cases as were filed.
According to the National Center for State Courts CourTool Measure #2 (Clearance Rates), courts should aspire to clear (i.e., dispose of) at least as many cases as have been filed/reopened/reactivated in a period by having a clearance rate of 100%. Montgomery County Circuit Court’s clearance rate analysis considers reactivated cases within its universe of open cases.

Figure 18 presents the court’s annual case clearance rates by case type for FY2000 through FY2014. By FY2014, the court’s overall clearance rate overall clearance rate was at 101%, ranging from a low of 93% in FY2009 to a high of 113% in FY2011. The minimum and maximum overall clearance rate values were largely driven by civil filings and terminations. For the past 15 years, 93% of the case type specific clearance rates were at 95% or above, and 60% were at 99% or above.

The civil clearance rate had the most variability between FY2000 and FY2014, ranging from a low of 84% in FY2008 to a high of 138% in FY2011. Despite continued increases in civil filings between FY2009 and FY2010 (approximately 9%), the civil clearance rate improved from 84% to 98%. The overall clearance rate improved to 113% in FY2011, and was driven primarily by the high civil clearance rate. This
improved civil clearance rate was due to the large drop in civil filings combined with a slight decline in civil terminations between FY2010 and FY2011.

In FY2012, the overall clearance rate was 102%, suggesting that the court was able to maintain an efficient level of case processing across case types. In FY2013, the overall clearance rate declined to 97%, which was the result of declines in the civil and family clearance rates. The decrease in the civil clearance rate was primarily driven by the declined clearance rate among original circuit court civil cases and Register of Wills cases. The family clearance rate decline was driven by reopened family filings/terminations.

In FY2014, the court’s clearance rate reached 102%, suggesting a reduction in the court’s case backlog. The case type with the largest increase in clearance rate over the last year is civil, which increased from 90% to 102%.

Figure 19. Number of Hearings Set and Held, FY2000 - FY2014

Source: Montgomery County Circuit Court, Data Processing. Transfer of the juvenile court from the District Court to Montgomery County Circuit Court occurred in 2002. Juvenile hearing data for fiscal years prior to FY2003 is not reflected due to differences in data collection approaches prior to the transfer.
Figure 19 displays the number of hearings set and held between FY2000 and FY2014. Since FY2000, the number of matters set for hearings increased by 20%, and the number of hearings held increased by 22%. There was a relatively large increase in hearings set and held (over 8,000 hearings) between FY2002 and FY2003. This increase is related to the transfer of juvenile jurisdiction from the District Court to the Montgomery County Circuit Court, as well as administrative changes made to judges’ calendars in compliance with Maryland Rule 9-208. Between FY2003 and FY2014, the court experienced a 2% drop in hearings set and a 7% decrease in hearings held, despite increases up until 2010. Due to how data related to hearings set and held are entered into the court’s case management system, the hearings held may not correlate directly with those that are set. For example, some hearings that are ultimately held may not have been originally set as a hearing, but rather as a conference.

Figure 20. Number of Trials Set versus Held, FY2000 - FY2014

Figure 20 depicts the number of trials set and held between FY2000 and FY2014. Since FY2000, the court experienced a 25% increase in the number of matters set for trial and a 74% increase in the number of trials held. There was a noticeable decline in the number of trials set (17%) from 10,664 in FY2010 to

For additional information regarding Maryland Rule 9-208 please access the following link: http://www.lexisnexis.com/hottopics/mdcode/, and access the Maryland Rules.
8,842 in FY2011. The decline in trials set continued in FY2012; however, it was less dramatic (7% decline). This drop is likely the result of efforts implemented as part of the revised criminal Differentiated Case Management (DCM) plan, which established 4-215 hearings aimed at scheduling trials on agreed-upon dates in criminal cases. With parties being actively involved in scheduling their trial dates, the need for postponements due to scheduling conflicts was anticipated to decline. The decline in trials set between FY2010 and FY2012 is also due in part to the implementation of settlement conferences in Track 3 civil cases, which allow parties another opportunity for resolution prior to setting the trial date. There was a slight increase in the number of trials set between FY2012 and FY2013 (2%) due to an increase (14%) in criminal trial settings. Except for a slight increase in family trial settings, the number of trials set in all case types decreased between FY2013 and FY2014.

Figure 21 displays trials held by case type between FY2000 and FY2014. The greatest increases in the number of trials held occurred between FY2002 and FY2003 (an increase of 380 trials held (44%) from 858 to 1,238); FY2004 and FY2005 (an increase of 131 trials held (11%) from 1,247 to 1,378); and FY2007 and FY2008 (an increase of 207 trials held (16%) from 1,270 to 1,477). The increase in trials held between FY2002 and FY2003 is due to the transfer of the juvenile court but also due to a 79% increase in family trials held from 333 in FY2002 to 595 in FY2003 (see Figure 21). The increase in trials held between FY2004 and FY2005 is driven by a 65% increase in the number of criminal trials held specifically court trials (as opposed to jury trials), which increased from 64 to 174 (172%). In FY2005, criminal trials held represent 20% of all trials held. The increase in trials held between FY2007 and FY2008 is driven by increases in civil and juvenile trials held by 33% and 36%, respectively. The number of trials held in all case types (except family) decreased between FY2013 and FY2014.
The trial utilization rate – the number of trials held of those set – ranged from a low of 12% in FY2007 to a high of 20% in FY2012 and FY2014. The trial utilization rate between FY2000 and FY2010 was 14%. Between FY2010 and FY2011, the first full year in which the majority of civil and criminal cases reaching trial had been filed under the revised DCM plans, the trial utilization rate increased from 15% to 19%. That rate remained unchanged between FY2011 and FY2014. Additional analyses are required to better understand how an increase in the trial utilization rate relates to trial date certainty. For example, an increase in the trial utilization rate may be the result of reducing the number of trials set and only holding trials when appropriate. However, the question about whether trials are held when initially set has yet to be fully explored. It is widely understood that due to the increased availability of Alternative Dispute Resolution (ADR), as well as the use of other means to resolve cases prior to trial (e.g., resolution and settlement conferences), trials serve as an effective, if relatively rarely utilized, mechanism for the resolution of cases that cannot be otherwise resolved. By encouraging the earliest appropriate resolution of cases, case management allows fewer trials to be set and, when set, held with greater certainty.

27 Register of Wills (ROW) trials are included. There were two ROW trials in FY2011 and none in the remaining fiscal years represented.

28 Depending on when the trial is set and held within the fiscal year, the trials held may not be of those set. For example, if a trial is held at the beginning of one fiscal year, it may have been set in the previous fiscal year.
**Case Processing Analysis**

As part of its effort to increase the efficiency of case processing operations and maintain cases at an optimum level, Montgomery County Circuit Court established a Differential Court Management (DCM) plan for each case type (civil, criminal, family, and juvenile) pursuant to the Maryland Rules of Procedure. These plans establish performance guidelines for each case type, creating a schedule of deadlines and hearings related to the complexity of the case and dedicating increasing judicial resources as case complexity increases.

The DCM scheduling guidelines are more detailed than the statewide case processing performance standards and support the court’s efforts to meet or exceed the statewide standards. The statewide performance standards, which were developed by the Maryland Judiciary in 2000, are utilized by all Maryland Circuit Courts and the District Court to evaluate their case processing performance and case processing efficiency. For circuit courts, case processing time standards are available for seven case types including civil, criminal, family, juvenile delinquency, child in need of assistance (CINA) shelter care, CINA non-shelter care, and termination of parental rights (TPR). The state case processing time standards present to the citizens of Montgomery County and Maryland the performance expectations of the judiciary as to the prompt resolution of cases in the furtherance of justice. In addition, the standards establish goals against which courts examine their operations.

* %WST: Percent of cases closed within the Maryland Caseflow Time Standards
† The number of family law terminations in FY2011-FY2013 is: 8,034; 8,532, and 8,144. These termination figures and associated performance percentages are not displayed because prior to FY2014 the Maryland Judiciary had slightly different time standards for family law cases. Please refer to the court’s case processing reports for family law case processing performance prior to FY2014.
‡ The statewide average (weighted) for limited divorce and other family law cases was calculated based on each jurisdiction’s overall family law case terminations, rather than its limited divorce terminations or other family law terminations. Accordingly, the percentages reflected may not be accurately estimated.

**Note:** The underlined %WST values indicate those that met the Maryland Judiciary’s time standard performance goal.
As shown in Table 8, in FY2014, a total of 17,174 original terminations were analyzed: civil (6,242), criminal (2,094), family law (FL) (8,029), juvenile delinquency (594), child in need of assistance (CINA) (195), and termination of parental rights (TPR) (20) cases. Of the 195 CINA cases, 139 are shelter cases and 56 are non-shelter cases.

A key measure of the annual case processing analysis is the percentage of cases terminated within the state-defined time standards. Between FY2013 and FY2014, civil and child welfare case processing performance improved. Performance declined by no more than three percentage points among criminal and juvenile delinquency cases. The Maryland Judiciary modified the FL time standard in FY2014. FL case processing performance is assessed against two different time standards: 1) 98% of limited divorce cases are to reach disposition within 730 days from filing; and 2) 98% of other FL (including absolute divorce) cases are to reach disposition within 365 days from filing. The court’s FY2014 FL performance is 99% for limited divorce cases and 94% for other FL cases. The court met or exceeded the Judiciary’s performance goals for TPR and limited-divorce cases.

According to the Maryland Judiciary, Montgomery County Circuit Court along with the circuit courts in Anne Arundel County, Baltimore City, Baltimore County, and Prince George’s County are considered ‘large’ because their number of presiding judges is equal to or greater than ten. In FY2014, Montgomery County Circuit Court ranked first or second to the other ‘large’ jurisdictions across five case types or case sub-types (see Table 9). Montgomery County Circuit Court ranked (or shared) first in civil, other family law, and TPR case processing, and ranked second in criminal and limited divorce case processing. The court ranked third in CINA shelter, ranked fourth in CINA non-shelter behind Anne Arundel, Baltimore City, and Prince George’s County who all tied for first, and fifth in juvenile case processing. It is important to note that some of the differences between jurisdictions are rather minimal, and jurisdictions may vary in their case processing procedures, which may ultimately contribute to differences in performance.
