

Appendix E

Existing Traffic Analysis

Montgomery County Department of Transportation (MCDOT) conducted an initial alternatives analysis for Bus Rapid Transit (BRT) service along the New Hampshire Avenue corridor. The study corridor is approximately 8.5 miles long, running from the District of Columbia boundary at Eastern Avenue on the southern end to the Colesville Park & Ride near Randolph Road at the northern end.

To accomplish this, the Project Team is using VISSIM microsimulation model to assess traffic conditions in the study area and identify potential roadway links for the implementation of BRT services. The development of the existing typical conditions model requires a proper calibration effort to closely replicate real-world conditions and accurately reflect field conditions. The objective of this technical memorandum is to document the VISSIM model calibration efforts for the existing conditions and summarize the model development process, model calibration process, and calibration results.

Introduction

The study corridor is in Montgomery County, Maryland. **Figure 1** shows the extents of the study corridor.

The study intersections are within Montgomery County, the District of Columbia (DC), and Prince George's County jurisdiction. Per initial scoping discussions, the microsimulation models will focus on the section starting at Heartfields Drive, just north of the US Route 29 interchange to Rittenhouse Street NE. The study intersections are listed in **Table 1**.

The model development and existing condition calibration process follows the Maryland Department of Transportation State Highway Administration (MDOT SHA) VISSIM Modeling Guidance¹.

Data Collection

Traffic Volume Data

Turning movement counts (TMCs) were collected during weekdays in December 2021 and January 2022. TMC data is included in Attachment 1. Based on collected data, the peak hours in the study area are identified as:

- AM Peak Hour - 7:15 AM to 8:15 AM
- PM Peak Hour - 4:45 PM to 5:45 PM

Speed Data

24-hour tube counts were collected on Wednesday January 19, 2022, at seven locations listed below:

- New Hampshire Ave south of Ray Rd
- New Hampshire Ave south of Sligo Creek Parkway
- New Hampshire Ave south of Quebec St
- New Hampshire Ave south of Oakview Dr
- New Hampshire Ave south of Overlook Dr
- New Hampshire Ave north of Schindler Dr-Mahan Rd
- New Hampshire Ave south of Heartfields Dr

Spot speed data is available in Attachment 2.

Travel Time Data

Field travel time data is not readily available along the study corridor. INRIX² probe data is extracted from the Regional Integrated Transportation Information System (RITIS) platform for comparison purpose. Peak hour travel time and speed data on typical weekdays (Tuesday, Wednesday and Thursday) in November 2019 were downloaded and processed. Holidays were excluded in the data processing. Travel time segments in the VISSIM network were coded accordingly to match the INRIX segments for calibration purposes.

² INRIX is a private transportation analytics company that can provide information on vehicle travel speeds.

Signal Timing

The latest traffic signal timing and phasing schemes have been provided by respective operating agencies on a per intersection basis including Montgomery County DOT, Prince George's County DOT, Maryland DOT SHA, and District DOT.

Transit Data

Transit routing and stops have been compiled from RideOn (23 routes), WMATA (24 routes), Flash (5 routes), and MTA (4 routes). Three tier of empirical dwell time (rather than boarding/alighting) distribution categories were developed using the General Transit Feed Specification (GTFS) data to model transit stops. The dwell time distributions are defined as:

- **Short dwell time distribution**
 - Lower Bound = 0 sec
 - Upper Bound = 5 sec
- **Medium dwell time distribution**
 - Lower Bound > 5 sec
 - Upper Bound ≤ 15 sec
- **Long dwell time distribution**
 - Lower Bound > 15 sec
 - Upper Bound = ∞

The assumptions have been reviewed and approved by County staff.

Model Development

The modeling was performed using PTV VISSIM 2020 microsimulation software. The network is coded per existing lane geometry. Roadway segments with turn bays are coded as links with all lanes accessible per MDOT SHA's VISSIM Modeling Guidance. The Wiedemann 74 car following model is applied to the arterials in the models. Default parameters of the car following model is used as the starting point for model calibration.

In reviewing of the historical AADT along the study corridor, it was found that 2019 AADT values were approximately 15% - 30% higher than the ADT tube counts collected in January 2022. Therefore, the balanced traffic volumes were adjusted by a percentage value varying between 15 and 30% at the respective select locations along the study corridor to reflect the typical traffic conditions. These adjustments also accounting for COVID-19 pandemic related traffic reductions. The volume inputs and assumptions were reviewed and approved by County Staff. Since the project is a transit-oriented study, bus volumes are not included in the Vehicle Input. Bus volumes are input as public transit frequencies.

Attachment 4 documents methodology and data related to existing conditions traffic volume development.

Calibration Targets

The calibration of the existing condition VISSIM models was performed based on the following guidance outlined in the MDOT SHA’s VISSIM Modeling Guidance.

- **Simulated Traffic Volume/Vehicle Throughput** - compares VISSIM model throughputs at study intersections to developed traffic volumes.
- **Simulated Travel Time and Speed** - compares simulated vehicle travel time and speed to field travel times and speed.

Table 2 provides detailed information on calibration targets for the quantitative measures as documented in the VISSIM Modeling Guidance. In close coordination with SHA, it was decided to use *simulated traffic volumes* and *simulated speed* for the calibration of the typical conditions VISSIM models.

Table 2 Simulated Measures and Calibration Targets per SHA VISSIM Modeling Guidance

Simulated Measure	Calibration Threshold/Target
Simulated Traffic Volume (vehicles per hour)	The volume calibrations should not exceed 10% of the count traffic volume and/or GEH<5.
Simulated Travel Time (seconds) and/or Speed (mph)	Within ± 10% for average travel time variation for small segments (no more than 1 mile long) and ± 5% over the entire corridor analyzed.

Calibration Methodology

Simulation Run Time

A warm-up period of one hour (3600 seconds) was applied prior to the analysis period to allow for the model to populate with a sufficient number of vehicles to better represent field conditions. The one-hour warm-up period is selected to ensure that all vehicles will be able to enter and exit the network when travelling from one end to another during the warm-up duration. The MOEs were not collected during the warm-up period.

The simulation run time was conducted for a one-hour peak period during the AM and PM periods, in addition to the one-hour warm-up time:

- AM Peak Hour
 - 6:15 – 7:15 AM – Warm-up
 - 7:15 – 8:15 AM – Evaluation Period
- PM Peak Hour
 - 3:45 – 4:45 PM – Warm-up
 - 4:45 – 5:45 PM – Evaluation Period

The simulation run time used in the existing typical conditions models will remain the same in the future condition models. In addition, a simulation resolution of ten is used in the typical condition models and the same value will be used in future analyses.

Sample Size Determination

The simulation model should run multiple times with different random seeds to capture the impact of the stochastic nature of the model on the results and to obtain statistically reliable model outputs. For this project, ten simulation runs were performed for AM and PM periods, respectively. The same number of simulation runs will be used in both future no-build and build condition models.

Driving Behavior Adjustments

Field visits indicated aggressive lane changing and car-following behavior particularly around the on- and off-ramps of the Capital Beltway due to the high levels of congestion experienced. These observations were also validated by the initial VISSIM results that indicated considerably lower travel speeds around the interchange with the default driving behavior compared to the field speeds obtained from field data. As a result, VISSIM's default driving behavior was adjusted. **Table 3** provides a summary of driving behavior adjustments used for the select links for the AM and PM VISSIM models. The parameters are within the suggested ranges of driving behavior parameters (DBP) in MDOT SHA's VISSIM Modeling Guidance.

Table 3 VISSIM Car Following Parameters

Model Parameters	VISSIM Default	MDOT SHA VISSIM Modeling Guidance Suggested Range	Adjusted
Car Following - Average standstill distance (ft)	6.56	3.28 to 6.56	4.66
Car Following - Additive part of safety distance	2.00	2.0 to 2.2	2.00
Car Following - Multiplicative part of safety distance	3.00	2.8 to 3.3	2.80
Lane Change - Minimum clearance (feet)	1.64	N/A	1.10
Lane Change - Safety distance reduction factor	0.6	0.1 to 1.0	0.1
Lane Change - Maximum deceleration for cooperative braking (ft/s²)	-9.84	-8 to -20	-13.84

Model Calibration Results

Traffic Volumes

Volume calibration uses ten runs of the model using ten different random seeds to vary the results. Those results are then averaged over all runs to serve as a comparison to the turning movement counts collected in the field. The volume calibration target is within 10% of the field counts and/or $GEH < 5$. The GEH Statistic is calculated as:

$$GEH = \sqrt{\frac{(E - V)^2}{(E + V)/2}}$$

where:

E = model estimated volume

V = field count

The smaller the GEH statistic, the closer estimated volumes from the model are to field counts.

The detailed volume comparison and GEH statistics are available in Attachment 3. Results indicate that for all the volume groups analyzed, at least 95 percent of the movements meet the volume calibration thresholds. **Table 4** summarizes the results of the GEH calibration.

Table 4: GEH Calibration Results

GEH Value	AM Peak		PM Peak		Target Met?
	Movements that exceed GEH value	Percent of links below target	Movements that exceed GEH value	Percent of links below target	
GEH Value > 2	42	91%	41	91%	Yes
GEH Value >5	9	98%	7	99%	Yes
GEH Value >10	0	100%	1	100%	Yes

Travel Time

Simulated travel time and speed on all segments were compared against INRIX data. **Table 5** and **Table 6** provide a comparison of the simulated travel time and INRIX travel time along with the calibration thresholds that need to be met.

Results show that during the PM peak hour, the simulated travel time are within the 10 percent range of observed INRIX travel time, meeting all calibration target. During the AM peak hour, the only segments that did not meet the calibration threshold is the northbound section from Piney Branch Rd to the Capital Beltway On-Ramp where INRIX data indicated shorter travel time and higher speed. Congestion is observed both in the simulation model and the field around at these segments. Vehicles heading towards the Beltway tend to move to the right most lane ahead of time and cause queue spillback passing several signalized intersections. It should be noted that during the volume development, the simulated volumes were increased by a relatively high percentage (15%-30%) to reflect the typical traffic condition. Considering the travel time on all other segments along the study corridor meet the calibration target, the overall simulated travel time calibration is deemed acceptable.

Table 5. AM Peak Hour INRIX Travel Time vs. Simulated Travel Time

68	68: Eastern Ave/Rittenhouse	51.73	D	43.2	D

Note: Grey rows indicated intersection not included in microsimulation model; results are using Synchro 11 software HCM 2000 methodology.

As shown in Table 6, most of the corridor during the AM and PM peak hours operates at LOS D or better, likely due to inbound and outbound traffic coordination carrying commuter platoons of traffic along New Hampshire Avenue. PM peak hour is showing congestion around the Adelphi Road and Oakview Drive intersections. This congestion source is identified from the heavy conflicts of southbound left turns at Adelphi Road and heavy northbound through demands on New Hampshire toward the I-495 interchange.

University Boulevard has been shown to operate near or at LOS D during both AM and PM peak hours. Given the high-volume demand at this intersection, it will become a heavy focus on future scenarios in anticipation of the Purple Line and future proposed transit improvements associated with this study.

Conclusions

This appendix described the New Hampshire corridor existing condition VISSIM model development and calibration efforts based on MDOT SHA's VISSIM Modeling Guidance. Based on the quantitative comparisons of simulated traffic volumes and vehicle speeds, it is concluded that the existing typical conditions calibration results meet the calibration targets. The adjustments made in the existing conditions AM and PM VISSIM models for calibration (e.g., changes in driving behavior, lane changing and, gap acceptance) will also be carried over to future condition models.

Existing PM VISSIM Demand vs VISSIM Volume Comparison

[illegible]

Attachment 4

Existing Conditions Volume Development

New Hampshire Avenue Corridor Study

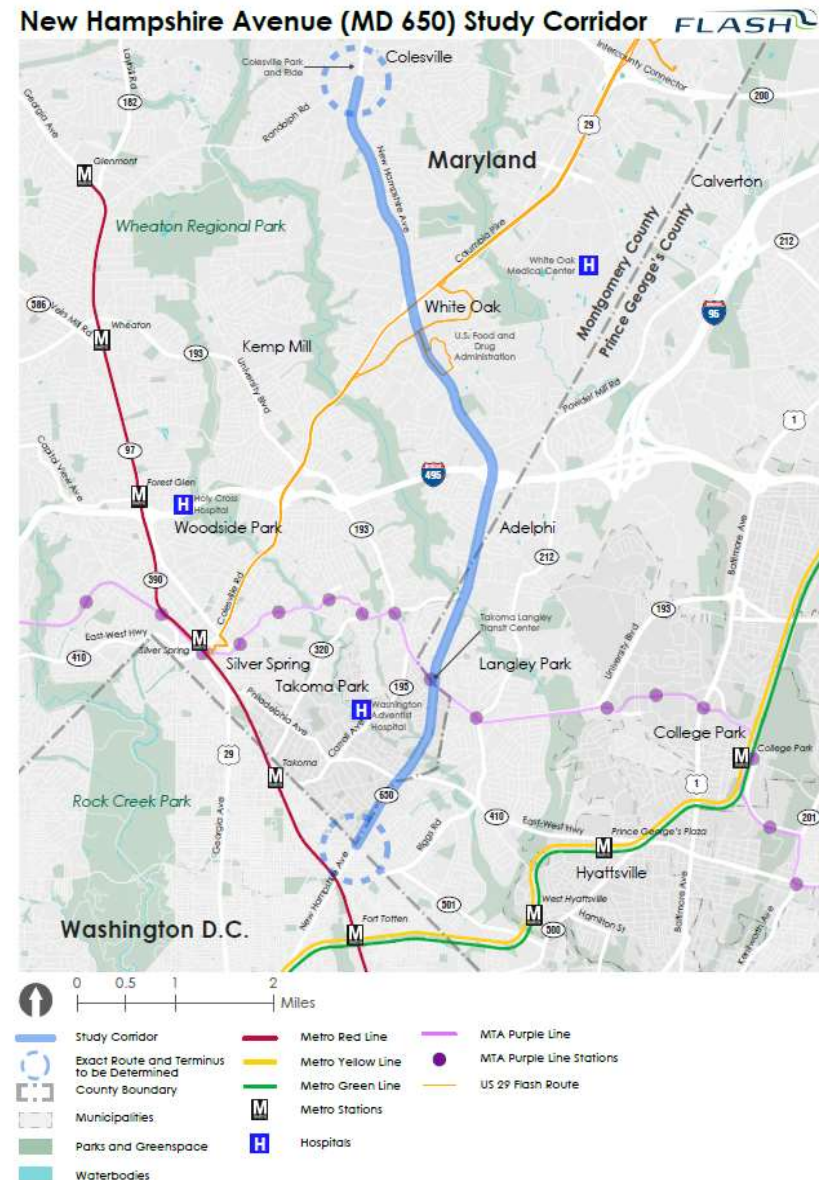

Existing Conditions Volume Development

May 10, 2022

Existing Conditions

Data Collection

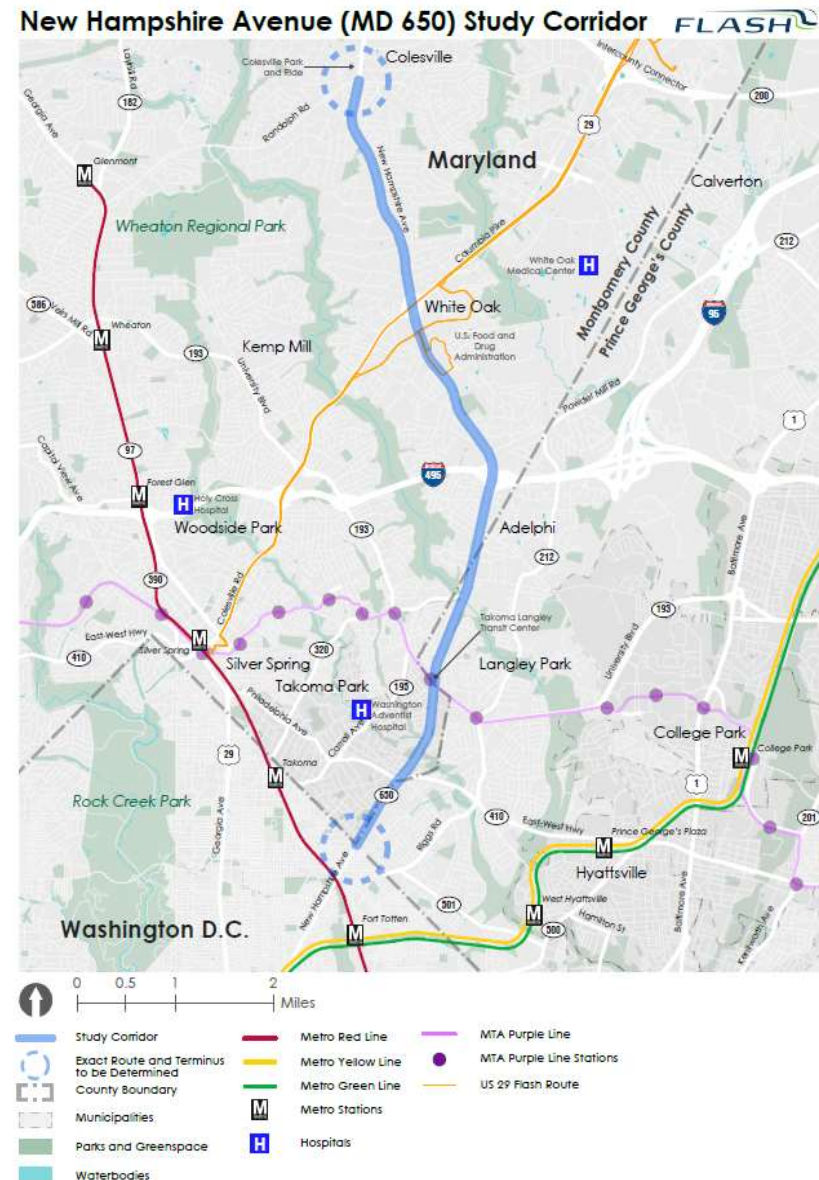

- Traffic Counts Collected:
 - December 7, 2021 (63 intersections)
 - January 12, 2022 (5 intersections)
 - January 25, 2022 (1 intersection)
- System-wide AM and PM peak hours
 - 7:15 to 8:15 AM
 - 4:45 to 5:45 PM

Existing Conditions

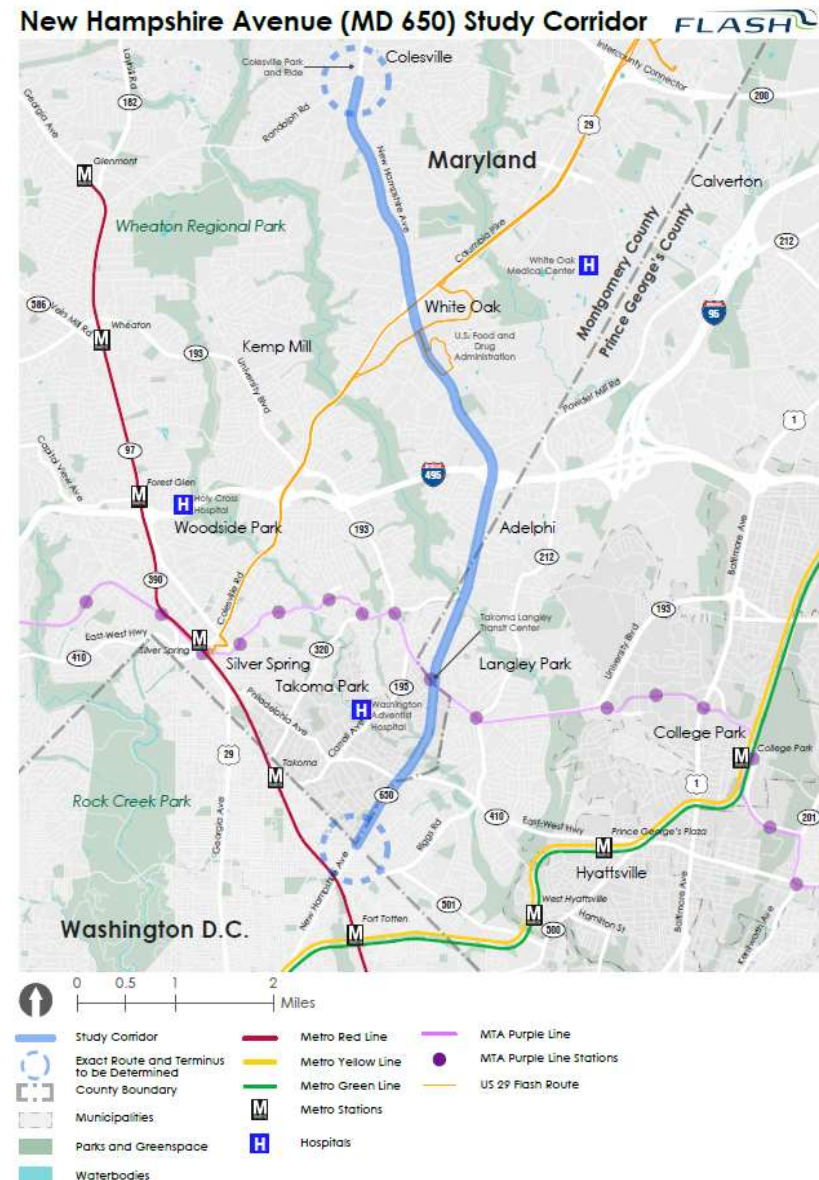

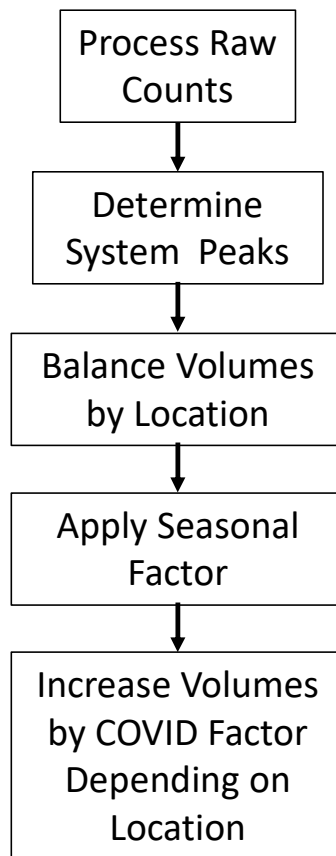

Data Processing

- System peak hour volumes balanced along corridor
 - For VISSIM extents, intersections were balanced to zero
 - North of Heartfields Drive, intersections allowed for volume differences to account for land uses/accesses between intersections
 - Balancing was aided by adding volume to minor street turns
- Once peak hour volumes were balanced, a seasonal factor was applied.
 - 2020 seasonal factor = 0.92.

Existing Conditions

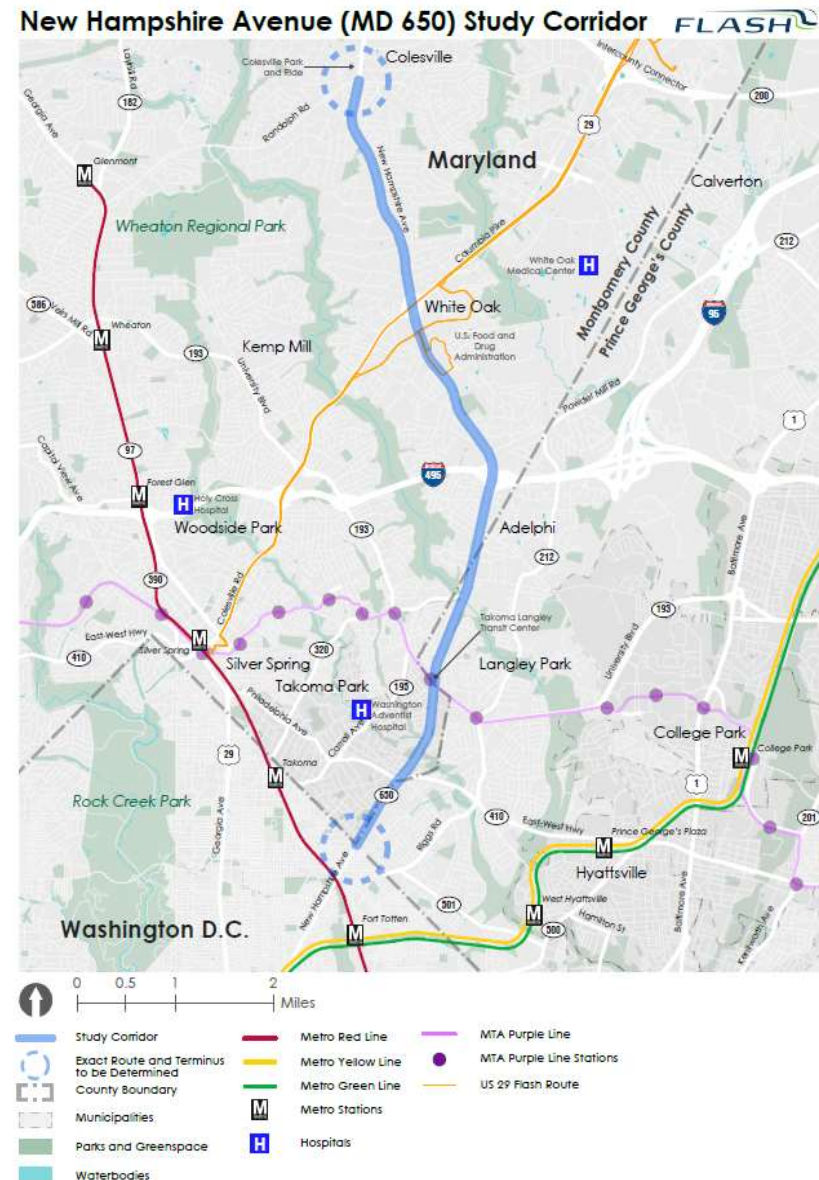

Data Processing Method

Existing Conditions

COVID Impacts

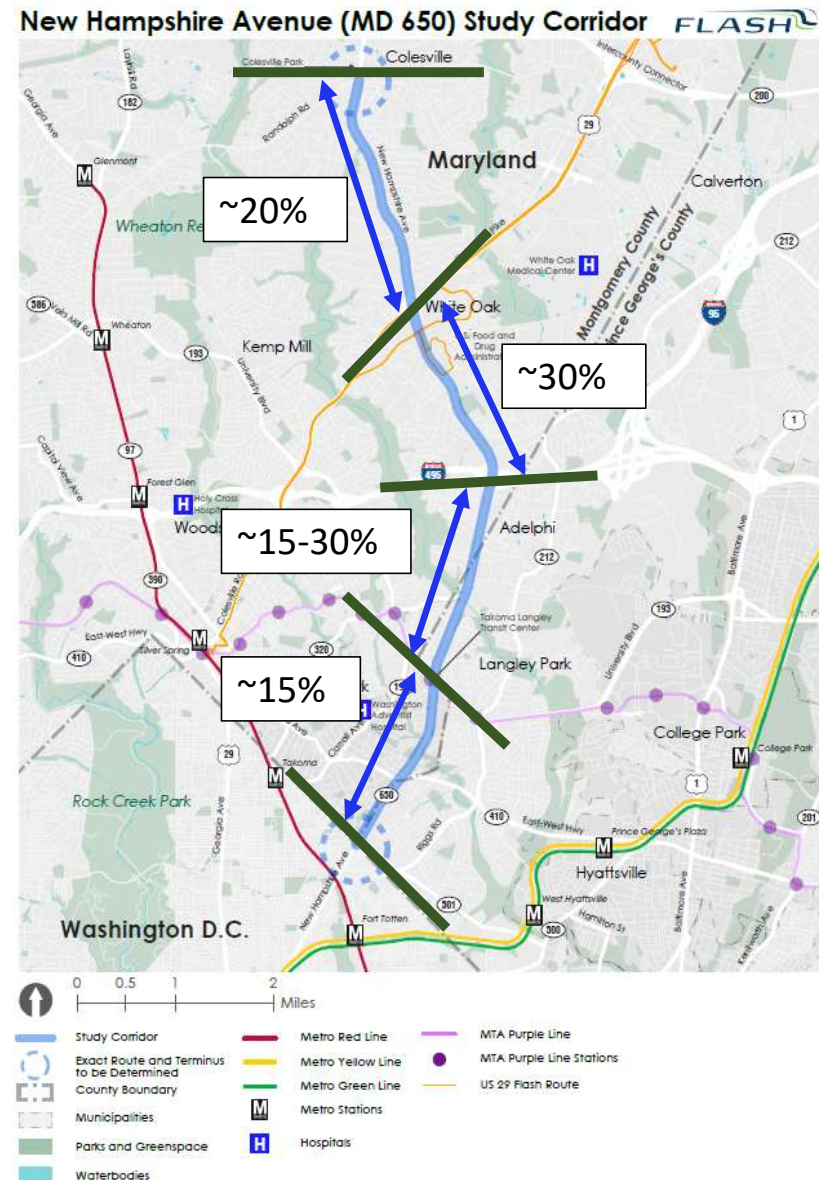

- Historical daily traffic volumes for Montgomery and Prince George's Counties obtained from MDOT
- Field collected ADTs reviewed against historical data to identify potential COVID impacts
- Field collected ADTs on New Hampshire Ave. were 15-30% lower than nearby 2019 traffic counts
- Conclusions:
 - Adjust peak hour volumes according to historical differences along corridor

Existing Conditions

COVID Adjustments

- 2019 historical counts were higher than field ADTs by varying amounts:
 - Columbia Pike to Notley Rd ~20%+
 - Capital Beltway to Columbia Pike ~30%+
 - University Blvd to Capitol Beltway ~15-30%+
 - Eastern Ave to University Blvd ~15%+
- Peak hour volumes were adjusted with these factors in each segment along the corridor to account for COVID impacts

Existing Conditions

Historical AADT Trends

Location	2017	2018	2019	2017-2019 Growth Rate
North of Randolph Rd.	43,252	42,863	44,200	1.09%
North of Columbia Pike	46,582	44,300	44,301	-2.48%
South of Columbia Pike	47,192	44,350	44,351	-3.06%
South of FDA	63,162	57,110	57,111	-4.91%
South of Capitol Beltway	80,752	80,470	80,471	-0.17%
South of University Blvd.	36,632	37,820	39,411	3.72%
South of Ethan Allen Ave.	42,232	39,650	39,651	-3.10%

NOTE: Most segments have experienced trending volume decreases between 2017 and 2019

This may be worth considering when forecasting future volumes.
