Handtevy CPR Assist

Handtevy is not just for pediatric patients.

The Handtevy Mobile application has added a new feature called CPR Assist. This allows the CPR boss to efficiently manage the timing of CPR cycles, ventilations and medication administration. It provides an easy way to document all aspects of the arrest, and after the call the results can be exported and uploaded to eMeds.

Those who have tried CPR Assist have reported a more streamlined experience and ease with reporting interventions.

Handtevy is installed and licensed on our Sonim apparatus phones. Units officers are encouraged to experiment with the application and to take the phone in to the scene during a cardiac arrest.

When resuscitating an adult patient, the ventilations should be set to continuous rather than 30:2.

Questions can be directed to an EMS Duty Officer.
