1. What is a FLIR Thermal Camera?

Thermal imaging can see what your eyes can’t. Thermal imaging cameras use color to show the relative temperature of objects: cold is purple, moderate is red, and hot is yellow. You’ll see hot and cold spots where insulation is missing, identify where air is getting in or out of your house, and more.

Use this FLIR Thermal Camera to look for energy efficiency opportunities in your home or business.

- In the winter, **purple** spots inside your home indicate a lack of air sealing or insulation.
- In the summer, these spots would appear **yellow** instead.

The camera takes thermal and regular pictures simultaneously, so you can easily identify the location of hot and cold spots in your home.

2. Using the FLIR Camera with iPhone

This camera is compatible with the following iPhone models: SE, 7, 7 Plus, 6, and 6 Plus. It is also compatible with the iPad and iPad Mini. For compatibility questions, contact FLIR ONE at 844-283-5471 or FLIRONESupport@flir.com.

1) Download and open the FLIR ONE app from the App store.  
2) Connect the camera to your phone facing out and press the camera’s power button. The button’s light will flash green when the device is ready. If you have a phone case, use the blue dial to adjust the connector height.
3) If the camera does not turn on, charge it with the USB cable provided. The small light next to the power connection blinks while charging and stays on continuously when fully charged. The camera requires about one hour to fully charge.
4) The app opens to either the camera or home screen depending on if the camera is turned on. Use the Menu buttons to navigate between the two. To access the camera, FLIR requires that you create an account.
5) With the camera screen open, use the white circle to take pictures. Select the library button at the bottom left to view your photos. Swipe up or down on a photo to reveal the normal image.
6) For more info, go to the Help section on the Menu drop down or the Tips and Tricks section on the home screen.

TIP: If the camera does not seem to work, reset it by holding the power button down for 30 seconds. Also try uninstalling the app, restarting your phone, and reinstalling the app.
Thermal imaging cameras use color to show the relative temperature of objects: cold is purple, moderate is red, and hot is yellow.

- In the winter, purple spots inside your home indicate a lack of air sealing or insulation.
- In the summer, these spots would appear yellow instead.

For the camera to function properly, make sure there is at least a 20-degree temperature differential between the inside and outside of your home.

### Drafty Door
Drafts often occur underneath doors. Add door sweeps to both regular and screen doors and check that existing door sweeps are in good condition.

### Leaky Windows
Even new windows can let air pass through around the edges. Add extra weather stripping along drafty spots.
4. More Energy Saving Opportunities

For more energy saving opportunities that you can identify with a thermal imaging camera, and for before and after photos of the projects above, visit our website at mygreenmontgomery.org/project/camera

**Leaky Outlets**
Exterior wall electrical outlets are often uninsulated. Block airflow with socket sealers.

**Electronics on Standby**
Electronics can still use electricity when not being used. Install a smart power strip to stop electricity from flowing to unused devices.
